

Mini-Split Heating & Cooling

Mini-split heating and cooling systems provide individual room temperatures, and whole-home comfort year round. These systems allow for a peaceful indoor environment because compressors and motors are installed outdoors.

Inverter Technology

Inverter technology is the cruise control for your heating and cooling system. Since the compressors only run as fast as they need to handle the heating or cooling demand, they can reach the desired temperature more quickly than conventional systems, and more stable in operation.

Individual Zone Control

Only heat or cool the areas you are using, with separate thermostats for up to 8 zones.

Ductless Systems

Duct losses account for more than 30% of your energy consumption in traditional systems. But mini-split systems have little to no duct work, saving you energy and money.

Style

Multiple style features are available to fit into any décor.
