

Boiler Replacement

BHT offers installation and replacement of gas fueled and biomass fueled boilers.

Gas Fueled: We can design and install a high efficiency boiler to replace your failing or inefficient heat source. Our gas fueled boilers operate at 92%-97% efficiency, lowering your fuel bills, and can utilize natural gas or propane. New systems are much smaller than old boilers, and vent through plastic pipes, eliminating the need for chimney repair.

Biomass System: Biomass Systems can be installed in new construction or retrofit over many central heating systems. Placed away from the home, these systems reduce the risk of fire and keep dirt, dust, smoke and bugs outside the home. Biomass stoves utilize cord wood, pellets, farm waste and construction waste as inexpensive fuel sources. Cordwood is supplied to the system in log form reducing the need for splitting.
