

On Demand Water

On Demand Water Heaters or Point of Use Water Heaters provide hot water on demand to faucets and showers, rather than wasting energy and water by holding hot water in a storage tank. On Demand heaters reduce water consumption, since you no longer need to run the water, waiting for it to get hot. They also save the consumer money by reducing repair and replacement costs cause by lime or mineral buildup. Since no coils come in contact with the water, mineral buildup issues are eliminated.
